One little thing (the first batch is really good) is that we dont want to use (in this paper yet) confidence interval as a dependent variable. The idea is to see how the IMR results from liberalization change if we include or dont include data quality as a control. That is the pitch of the first paper. In other words, the main attraction is "How much is data quality hiding gains?" But the idea to think about *deliberalizers* is nice! I think this is a nice extra. The paper should be "Infant Mortality, Liberalizations and Interventionism: A Causal Analysis Accounting for Data Quality." Thus

Test 1: 1 point jump with no data quality control

Test 2: 1 point jump with data quality control

Test 3: 1 point jump with no data quality control but removing all *deliberalizers* (those in test 5 and 6) from control

Test 4: 1 point jump with data quality control but removing all *deliberalizers* (those in test 5 and 6) from control

Test 5: 1 point drop with no data quality control

Test 6: 1 point drop with data quality control

Test 7: 1 point drop with no data quality control but removing all *liberalizers* (those in test 1 and 2) from control

Test 8: 1 point drop with data quality control but removing all *liberalizers* (those in test 1 and 2) from control

This makes an even better paper and we send it to *Health Economics*, *Journal of Health Economics*, *Southern Economic Journal*, *European Economic Review*, *European Journal of Political Economy*, *Economic Inquiry*, *Economics & Human Biology*, *Public Choice* (the bioeconomics section), *Journal of Policy Modeling*, *Economic Modelling*, etc.

But in practice, you already did the tests for part of the next paper. Both get written at the same time. Nice! All we'll need to do is swap for state capacity and democratization as the treatment definition. Do Expansions of State Capacity and Democratization Improve Data? — This would definitely be nice to propose to a big polisci journal like APSR, AJPS, and then *Journal of Public Economics*.
